Project Overview

Project Name
Unistore : A Platform for Buying, Selling, and Renting University Student Supplies

Business Problem
College students have trouble buying necessary school supplies, like computers and books, because of their price and the necessity to upgrade those supplies each semester. Most school supplies have a short useable duration; therefore, making there purchase economically inefficient for many students .

Proposed Solution
The system is an online marketplace that enables students to buy , sell or rent academic supplies (laptops, books, and study tools) This platform aims to provide multiple affordable options at reasonable prices, which contributes to easing the financial burden on students and enhancing the utilization of available resources among them.

Target Audience
- University students
- Freshmen
- Students wishing to sell or rent their supplies
- Individuals looking for study supplies at reasonable prices

System Idea
Users will have to set up an account to browse available products categorized by type (buy, sell or rent). Once a user finds an item they are looking for, they will be able to contact the seller (email and phone) and finalise the transaction on the website or by contacting the individual directly. Users will also be able to list for sale or rent items as well as find other available items.

Key Features
- A centralized marketplace that provides a wide range of student supplies for in one place (books, electronic devices, other materials needed to study efficiently).
- multiple options to meet students needs including Buying, Selling , and Renting .
- Easy, fast way for students to find supplies.
- Encourages reuse of used supplies instead of throwing them away.

Home page

This website homepage is a project I worked on to create a website for College and University learners, where they can buy, sell or rent learning materials.

The first step was to create the page structure with HTML, which was divided into a number of sections - header, search bar, welcome bar, categories, products and footer (layout). The creation of page structure involved the coding of the layout into HTML with sections laid out as Header, Search Bar, Welcome Bar, Categories, Products and Footer. After the page structure was created, I then formatted the page using CSS. When creating my CSS used various properties to format the colours and sizes of the elements within the page but chose to use the colour blue to ensure that the website had one theme and colour.

When creating the header, I added the logo, page name and navigation links (e.g., Home, Sell and Rent). I used flexbox to help me arrange the links so it was easy to find.

The search bar is designed to help the users find products easily.

The Welcome bar consists of a title, a brief description and a navigation button.
I then created categories for products, Books, Tools, Devices , and Notes for the courses.

Finally, I designed the Products section to showcase Example items , Book, Calculator, Laptop in a card layout and CSS using flexbox.

Login& sign up

The login page is designed for users to securely access their accounts. I created the page structure using HTML , including a login form, and footer. The login form contains the following input fields: email, password, and “Remember me” checkbox. I also included a link for users who don’t have an account, directing them to the Sign-up page

The sign-up page allows new users to create an account. The page is structured with a sign-up form and footer. The form includes input fields for full name, phone number, email, password, and a user type selection to choose whether the user is a Seller or Buyer.

The CSS used for styling maintains a consistent look across all elements of the page including the input and button elements that are all styled in dark blue color. I also took advantage of flexbox for centering the form to the center of the page and made it responsive to any size screen.

Browse items & Cart

A web portal for Unistore was created in order for students to conveniently browse and order necessary supplies for school.

A clean and professional design was desired as a way to provide an easy-to-navigate experience to the user.

The first step in creating the Unistore website was designing a product display page with all the various books and supplies in a neat and organized format. The displayed products were organized using card-style displays (cards) where each card contains a graphic of the product, a product description (name), price, and an “Add to Cart” button.

When creating the product cards, care was taken to ensure that the spacing, color, and product size were well designed in order to produce an attractive and complimentary appearance, while keeping the card design at a width that would replicate the experience of using the site from a mobile device.

Once the product display page was created, we added a shopping cart that allows the user to view what they have added to their cart and remove/change what they have added.

In addition to the shopping cart features, we added an order summary to help the user decide if they want to purchase the products they have added to the cart by displaying both a total count of the number of products within the shopping cart, as well as the total amount of money for the purchase of the products added to the shopping cart.

The addition of a Homepage button and a Modal confirmation window after a purchase are just two of the improvements you will see throughout these pages, as all pages connect with each other resulting in a more user-friendly experience and present an interactive and professional user interface for the entire site.

The structure of all pages have been built using HTML, and the design has been formatted with CSS. Each page has been built using Flexbox in order to allow for a flexible and responsive presentation of the page components. In addition, both pages maintain the same design elements in order to provide users with consistent and friction-free user experience.

This project is based on one simple but fundamental principle: A well-designed and organized website will greatly improve the shopping experience for any student who needs a quick and easy way to find what they need.

Add new item & Support

Explanation of the Ghala Part

I completed two pages in HTML and CSS, and the Appsmith website helped me visualize my project before starting.

First, the "Add New Item" page:
By utilizing this, I was able to complete my work on the "Add New Product" page. On this page, my website allows the client to add a product to showcase to buyers. They can add the product name, category, contact number, and other important information. The request is then submitted to the relevant department via our website for review and verification of the client's (seller/lessor's) credibility. This ensures the quality of workflow and product reliability for our customers (buyers/lessees).

Second, the "Support" page. We need to gain loyal and trusted clients, whether sellers, or buyers, because our website focuses on both parties. Therefore, their voices are heard. I designed a page to support the client and address their complaints, whether technical or related to the seller reporting someone who is not a reliable source. We are trustworthy and do not adhere to the agreement, either on the buyer's side or when they receive an order with errors or one that does not match the picture. We also strive to resolve customer issues between them to gain reliable clients in our work. Therefore, these two pages are very important for students due to their limited experience. The support page and the product listing page were designed to be simple and clear, yet comprehensive, because reliability is paramount. This is what distinguishes our website from others: we prioritize reliability and customer satisfaction. By doing so, we gain loyal customers and support them throughout their journey.

Checkout

Upon landing on the e-commerce site's checkout page, users are prompted to provide their contact information, such as name and phone number, for effective communication between the seller and buyer regarding delivery options and payment arrangements.

Having delivered information, customers are then given the opportunity to select their delivery option; whether they would like to receive their product directly from the seller or if the seller has pre-arranged alternate methods for the delivery of their order. Users with the ability to choose an appropriate (to them) method to receive an item are more likely to make purchases than those who feel restricted in how they will get it.

Once users have chosen the appropriate delivery method, they can then select from two payment options; either via bank transfer or cash on delivery. The availability of several payment methods increases the customer's satisfaction level during the entire process of completing an online order through your online store.

As discussed above, your Order Summary includes all the items ordered along with their total amount. The Order Summary is also where the user has the ability to confirm that their information matches what they have ordered prior to submitting the order.

To complete the transaction, the user clicks on "Submit Order", which will then transmit the transaction to the seller for processing. In summary, this is a process.
